SQL Database (Store)

Number	Title	Type	Severity	Status	Score	Description	Mitigations
1	SQL Injection	Tampering	Low	Mitigated		Attacker inserts malicious database commands into an input field to trick the application into executing unintended code.	Leverage parameterized queries to force the database to treat user input as literal text rather than executable commands.
2	Lack of Logging	Repudiation	Low	Mitigated		A user performs an unauthorized action and denies it because there is no permanent, indisputable record of the transaction.	Implement Audit Logging to record the "Who, What, and When" of every database change in a secure, read-only log to ensure non-repudiation.
3	Clear-Text Data Exposure	Information disclosure	High	Open		Sensitive data is stored or transmitted without protection, allowing unauthorized parties to read private information if they gain access.	Use strong encryption algorithms for data at rest and in transit to ensure the information remains unreadable to anyone without the proper keys.
